Early Adult Onset Deafness For Border Collies only (Linkage test)

Early Adult Onset Deafness is a disease of gradual hearing loss affecting both ears. This test is a linkage test and relevant for the Border Collie breed only. The disease causing variant has not yet been identified.

MOLE has 1 copy of this variant for this condition.

What it Means for MOLE

Please note this is a linkage test and MOLE is predicted to have one copy of the Early Adult Onset Deafness For Border Collies only (Linkage test) mutation. Two copies of the Early Adult Onset Deafness For Border Collies only (Linkage test) mutation are needed for a dog to be affected by this condition, so MOLE should not show disease signs due to this mutation. Please note that similar disease signs could develop due to a different genetic or clinical cause.
